INCIDENT LIFE CYCLE AUTOMATION

Planning Logic

Reasoning behind the implementation sequence

STUDENT NAME Nareshkumar S	PROJECT **Incident Life Cycle Automation**
DOCUMENT DATE **08 October 2026**	SCOPE **Incident lifecycle workflow & automation only**

1. Dependency Logic

Order	Why It Comes Here
1. Intake	The system cannot automate later lifecycle steps until a valid incident record exists.
2. Triage & Priority	Routing and SLA decisions depend on reliable classification and priority.
3. Assignment	Ownership must be established before meaningful investigation tracking.
4. SLA Monitoring	SLA timing becomes useful after priority/ownership and due-time rules are available.
5. Investigation & Resolution	Operational work must be captured before an incident can be resolved.
6. Closure & Audit	Closure completes the lifecycle while preserving the final history.
7. Dashboard & Notifications	Visibility and alerts are layered over the working lifecycle rather than built first.

2. Completion Criteria

- A valid incident can enter the lifecycle.
- Authorized users can move the incident through allowed states.
- Assignment, SLA and escalation events are recorded.
- Resolution and closure retain the lifecycle history.
- Search/dashboard features expose the core operational state.
