INCIDENT LIFE CYCLE AUTOMATION

Proposed Solution

Project-level solution statement and value proposition

STUDENT NAME Nareshkumar S	PROJECT **Incident Life Cycle Automation**
DOCUMENT DATE **08 October 2026**	SCOPE **Incident lifecycle workflow & automation only**

Parameter	Project-Specific Description
Problem to solve	Reduce manual hand-offs by managing an incident as one continuous, traceable lifecycle.
Solution	Capture the incident, validate details, determine priority, assign ownership, monitor SLA, escalate when required, record resolution and close the incident.
What makes it useful	Repeatable lifecycle rules are built into the workflow so common next actions do not depend entirely on manual follow-up.
User value	Reporters gain visibility; support teams gain ownership clarity; managers gain SLA control; reviewers gain history.
Scalability within scope	The same lifecycle can be extended with additional queues, priority rules and SLA policies without changing the core concept.

Scope Boundary

The implementation should remain focused on incident lifecycle automation. Extra modules that are not needed for intake, handling, SLA, resolution, closure or audit history are excluded.
